

# MOnitoring Outbreak events for Disease surveillance in a data science context

HORIZON 2020 PROJECT, GRANT AGREEMENT N°874850

TIMOTHEE DUB, FINNISH INSTITUTE FOR HEALTH AND WELFARE

ONE HEALTH IN PRACTICE IN SOUTHEAST ASIA, CAPITALISATION COLLOQUIUM

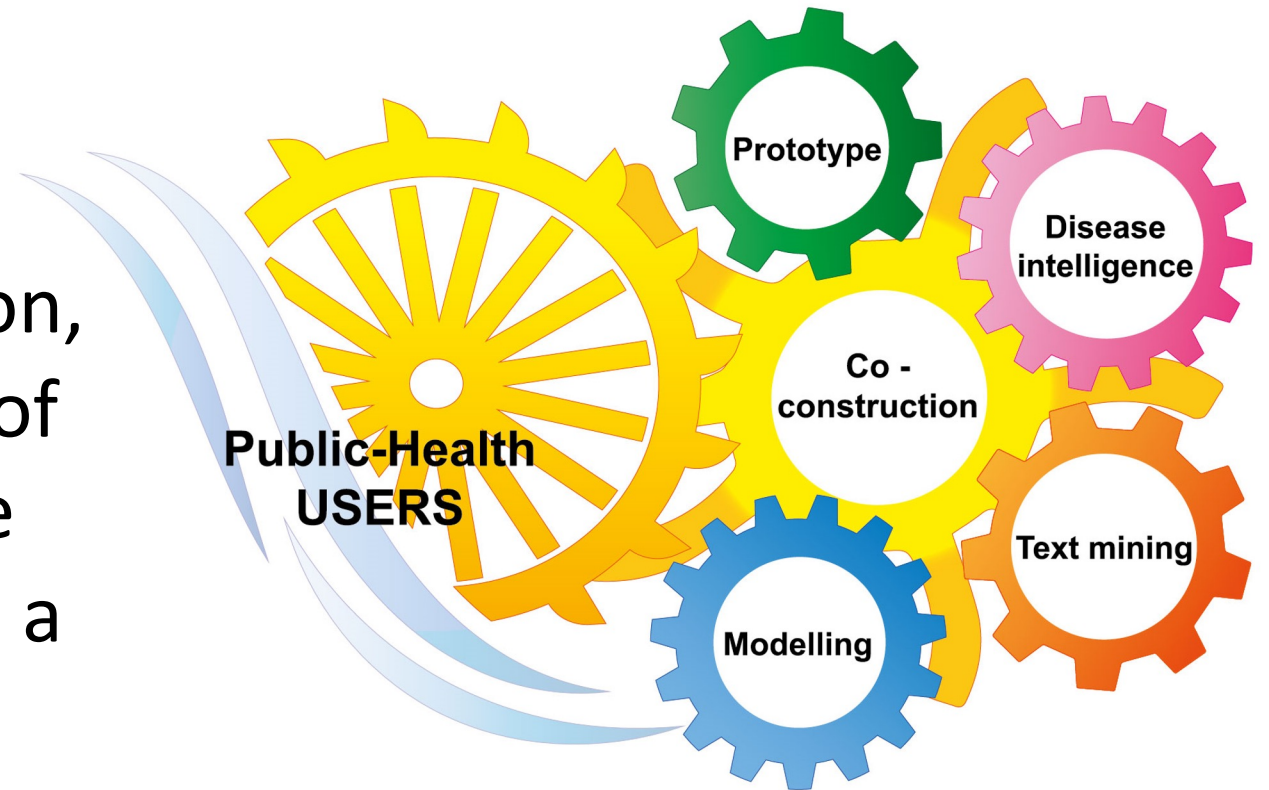

26/04/2023

## GOALS

H2020 project duration: 2020-2023

Develop innovative tools and services for the early detection, assessment, and monitoring of infectious disease emergence from multi source Big Data in a “One Health” context

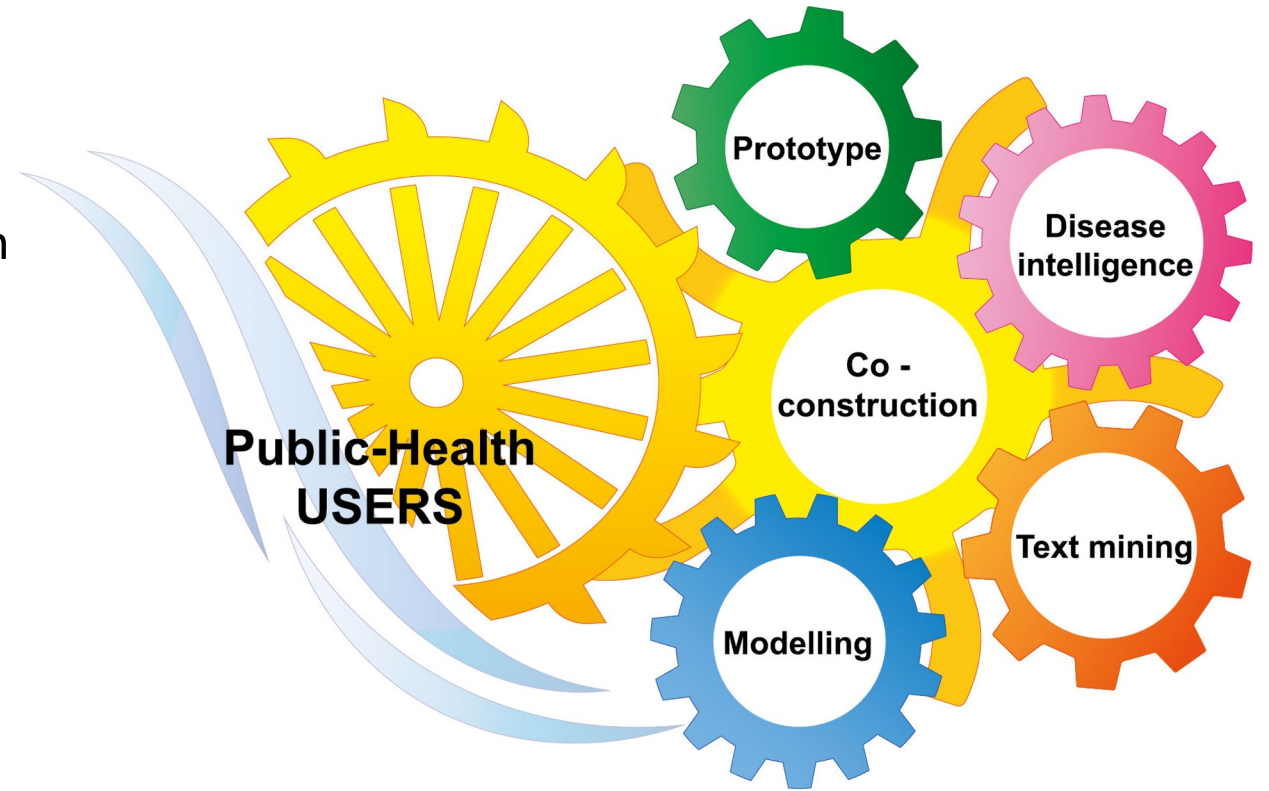

# MOOD'S ORIGINALITY

## Approach

Co-conception of tools and services based on end-user needs at national and supra-national public /animal health agencies

From user needs to research & development for improved epidemic intelligence and disease surveillance in Europe and beyond

## THE MOOD PLATFORM

A new platform to enhance detection, monitoring and follow-up of disease emergence in Europe

# THE MOOD PLATFORM

**1. Data & covariates access**

**2. Event-based  
Surveillance data (EBS)**

**3. Disease risk mapping**

# THE MOOD PLATFORM

**1. Data & covariates access**

**2. Event-based  
Surveillance data (EBS)**

**3. Disease risk mapping**

**Generic modules**

**Disease specific  
module**

# A MODEL-DISEASE APPROACH

	HPAI 	TBE 	COVID-19 	WNV 	AMR 	TU-LEPT 	CHI-DEN-ZI 
1.  <b>Covariates access</b>	✓	✓	TO BE CONFIRMED	✓	TO BE CONFIRMED	✓	✓
2.  <b>Epi Data Explorer</b>	✓	✓	✓	✓	✓	✓	✓
3.  <b>Disease risk mapping</b>	✓	✓	TO BE CONFIRMED	✓	✓	TO BE CONFIRMED	✓

## COVARIATES ACCESS MODULE

One stop shop: <https://mood-platform.avia-gis.com/>

A wide range of **standardized** covariate data layers

- Raster data
- Time series data

V0 → V1

- View
- Compare
- Download

# WHERE DOES THE DATA COME FROM?

**Already available but not standardized and ready to use!**

1) Convert all data maps to images with same pixel size (resolution). Then extract values for each data type at fixed sample points (hatched squares). NB one of these must be the 'known' values.

3) Providing the equation is statistically significant (i.e. reliable), apply the right hand side of the equation to all the pixels in the images, not just the ones sampled.

2) Calculate a 'regression equation' of the form:  
 $\text{Known} = \text{Constant} + A * (\text{Predictor 1}) + B * (\text{Predictor 2}) \dots$   
 NB There can be several predictor variables in the equations.

4) Repeat the process for each of a series of analysis zones (e.g. ecozones)

From Willian Wint & Neil Alexander

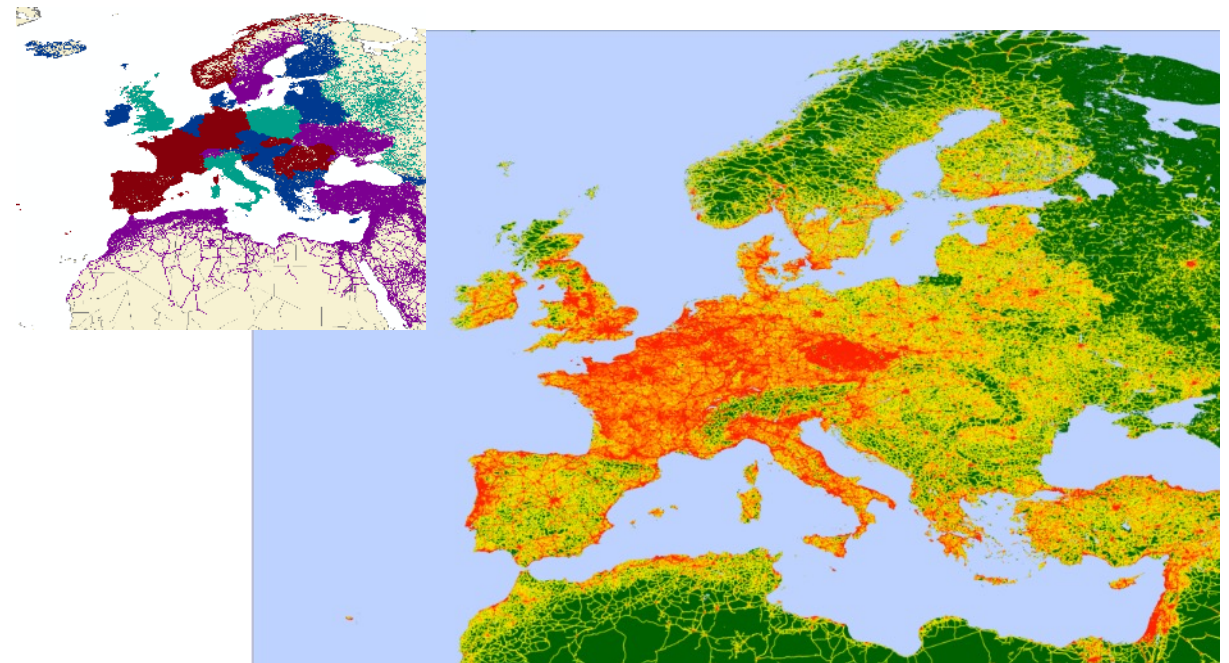

# MOOD MOOD GENERATES NEW DATA

**Examples of acquisition for COVID related work: As is often the case the 'raw data' need to be not only standardised but processed to meet user needs, going since March 2020.**

**75000 downloads from figshare**

**Accessibility: Trick is to convert to model friendly parameter – here road density, Could also be distance to... Global first surprisingly**

**Some obvious ones were missing in model friendly format:**  
**Relative humidity**  
**Wind**

## COVARIATES ACCESS MODULE

Version 2, pending

- Integration of more vector data
- **Downloadable data queries**
  - Data points or polygon
- Documentation of layers
- Processing methods
- Link with MOOD Epid Data Explorer tool

## OUTREACH TO NON-EUROPEAN ACTORS

- **Current geographical scope of the platform = Europe.**
- **Sustainability of the platform through a non-profit organisation**
  - Possibility to enlarge the scope
  - Maintain and add data in the future
- **Platform**
